B-1

APPENDIX B
DYNAMIC OUTPUT

The dynamic program was used to generate data for eight model configurations at four heading angles and four wave heights. The model parameters are identical to those used for the static program and listed in Table A-1. There are twelve configurations in Table A-1. With regard to dynamic boom response, however, four of these models have identical pairs. For example, configurations "V" and "VI" are identical except for the position of the shear center which is assumed to have no bearing on the boom's dynamic behavior. Thus, these two models are treated as one in the dynamic program.

Table B-1 presents the parameters that were used as input to the dynamic program with each set of model parameters.

TABLE B-1. PARAMETERS USED IN DYNAMIC PROGRAM

Configuration	Significant Wave Height H_s , ft.	Heading Angle, θ^* , degrees	Tension, T, lb.
I	3.94, 5.0, 7.9 and 10.0	5, 30, 60 and 90	-30,000
III	7.9, 10.0, 15.8 and 20.0		-75,000
IV			
V and VI	3.94, 5.0, 7.9 and 10.0		0., 2000. and 4000.
VII and VIII			
IX and X	7.9, 10.0		
XI and XII	15.8 and 20.0		

Note: Heading is the angle between the axis of an infinitely long, straight boom and the direction of wave propagation.

HYDRONAUTICS, Incorporated

B-2

A 5-degree heading angle was used instead of zero degrees because horizontal motions are zero at zero heading. The vertical motions at the 5-degree heading are nearly the same as for zero degrees. The values for tension are based on the results of the static program (Appendix A). Configurations V through XII have a range of tensions so that interpolation may be used to find the motions of a boom at any intermediate value of tension. The tension (compression) for each configuration I through IV is, nominally, a constant so that no interpolation is needed for these configurations.

The boom dynamic response data is contained in the tables that follow. The tables are in a specific order which is indicated in the following, partial list of tables:

APPENDIX C
STATIC EQUATIONS

NOTATION

A	Effective structural cross-sectional area of boom
CA	Angular (α) mooring spring constant
CB	Angular (β) mooring spring constant
c_D	Drag coefficient
CG	Distance from boom axis to center of gravity
CT	Angular (θ) mooring spring constant
CX	X direction mooring spring constant
CY	Y direction mooring spring constant
CZ	Z direction mooring spring constant
E	Modulus of elasticity
G	Shear modulus of elasticity
I_H	Horizontal boom section moment of inertia
I_V	Vertical boom section moment of inertia
J	Boom section polar moment of inertia
L	Total boom length; a characteristic length
ℓ	One half length of boom element (Fig. C-2)
M _N	Bending moment in normal plane on end of boom element (Fig. C-3)
M _T	Bending moment in tangential plane on end of boom element (Fig. C-3)
Q	Torque on end of boom element (Fig. C-3)
q	Distributed torque along boom element (Fig. C-3)
S _N	Shear on end of boom element in normal plane (Fig. C-3)

HYDRONAUTICS, Incorporated

C-2

- SNL Distributed shear along boom element in normal plane
 (Fig. C-3)
- ST Shear on end of boom element in tangential plane
 (Fig. C-3)
- STL Distributed shear along boom element in tangential
 plane (Fig. C-3)
- T Tension on end of boom element (Fig. C-3)
- TI Distributed tension along boom element (Fig. C-3)
- x Reference streamwise coordinate of end of a boom
 element (Fig. C-1)
- y Reference coordinate normal to streamwise direction
 of end of a boom element (Fig. C-1)
- z Reference vertical coordinate of end of a boom
 element (Fig. C-1)
- α Angle between x-z plane and projection of end of boom
 element on the water surface (x-y plane) (Fig. C-1)
- β Angle between boom element and water surface (x-y plane)
 (Fig. C-1)
- γ Linear deflection of boom element in the normal plane
 (Fig. C-2)
- $\Delta\beta$ Change in β (angular deflection) in one-half the length
 of a boom element (Fig. C-2)
- $\Delta\epsilon$ Change in ϵ (torsional deflection) in one half the
 length of a boom element (Fig. C-2)
- $\Delta\phi$ Change in ϕ (angular deflection) in one half the length
 of a boom element (Fig. C-2)

HYDRONAUTICS, Incorporated

C-3

- s Linear deflection of end of boom element in the tangential plane (Fig. C-2)
- θ Torsional deflection (Roll angle) of boom element (Fig. C-2)
- ϕ Angle between x-z plane and end of boom element
- ρ Axial elongation in one half of boom element (Fig. C-2)

Subscripts

- i i'th element on boom
- l first element of boom
- k last element of boom

HYDRONAUTICS, Incorporated

C-4

The numerical solution for the loads and configuration of an oil retention boom under conditions of steady wind and current requires the simultaneous solution of four types of equations. These equations are described in the following paragraphs.

The forces, moments, and geometry are defined in Figures C-1, C-2 and C-3 for a typical element of the boom. The four types of equations and their basic functions are listed below.

(1) "Equilibrium" equations: These equations relate the forces and moments on one end of an element to the forces and moments on the other end of the element in terms of the deflections and the applied loads.

$$(T_i + T_{i+1}) \cos \Delta\beta_i \cos \Delta\phi_i - 2l TL + (ST_i + ST_{i+1}) \Delta\beta_i + (SN_i + SN_{i+1}) \Delta\phi_i = 0 \quad (C-1)$$

$$(SN_i - SN_{i+1}) \cos \Delta\phi_i - 2l SNL - (T_i + T_{i+1}) \Delta\phi_i = 0 \quad (C-2)$$

$$(ST_i - ST_{i+1}) \cos \Delta\beta_i - 2l STL - (T_i + T_{i+1}) \Delta\beta_i = 0 \quad (C-3)$$

$$(w_i - w_{i+1}) \cos \Delta\beta_i \cos \Delta\phi_i - 2l QL + (MT_i + MT_{i+1}) \Delta\beta_i - (MN_i + MN_{i+1}) \Delta\phi_i = 0 \quad (C-4)$$

HYDRONAUTICS, Incorporated

C-5

$$(MN_i - MN_{i+1}) \cos \Delta\phi_i - (ST_i + ST_{i+1}) \ell + (Q_i + Q_{i+1}) \Delta\phi_i = 0$$

(C-5)

$$(MT_i - MT_{i+1}) \cos \Delta\beta_i - (SN_i + SN_{i+1}) \ell - (Q_i + Q_{i+1}) \Delta\beta_i = 0$$

(C-6)

The distributed loading along the boom (SNL acting normal to the vertical reference plane and STL acting tangential to the vertical reference plane) is assumed to be uniformly distributed along the length of the element.

(2) "Deflection" equations: These equations express the deflections of each element in terms of the applied loads and the forces and moments on the ends.

$$\rho_i = \frac{1}{2} \frac{\ell}{EA} (T_i + T_{i+1}) \quad (C-7)$$

$$\delta_i = \frac{1}{2} \ell \cdot \Delta\beta_i \quad (C-8)$$

$$\gamma_i = \frac{1}{2} \ell \cdot \Delta\phi_i \quad (C-9)$$

Equations (C-8) and (C-9) assume that each element has a circular arc deflection curve. This assumption is necessary to make the tension terms in the deflection and equilibrium equations compatible in the limiting case of a boom with zero stiffness.

HYDRONAUTICS, Incorporated

C-7

(3) "Shape" equations: These equations relate the position of one end of each element to the position of the other end in terms of its angular position and the deflections within the element. They determine that the end of each element has the same position and orientation in space as the adjacent end of the mating element (i.e., the boom forms a smooth continuous curve).

$$x_{i+1} - x_i = (\ell + \rho_i)(\cos \beta_i \cos \alpha_i + \cos \beta_{i+1} \cos \alpha_{i+1}) \quad (C-13)$$

$$y_{i+1} - y_i = (\ell + \rho_i)(\cos \beta_i \sin \alpha_i + \cos \beta_{i+1} \sin \alpha_{i+1}) \quad (C-14)$$

$$z_{i+1} - z_i = (\ell + \rho_i)(\sin \beta_i + \sin \beta_{i+1}) \quad (C-15)$$

$$\theta_{i+1} - \theta_i = 2\Delta\theta_i \quad (C-16)$$

$$\beta_{i+1} - \beta_i = 2\Delta\beta_i \quad (C-17)$$

$$\alpha_{i+1} - \alpha_i = \Delta\phi_i (\sec \beta_i + \sec \beta_{i+1}) \quad (C-18)$$

(4) "Boundary Condition" equations: These equations relate the forces and moments on the ends of the boom to their location and orientation in space. The equations for the free end of the first element are:

HYDRONAUTICS, Incorporated

C-8

$$T_1 \cos \alpha_1 \cos \beta_1 - S_{N_1} \sin \alpha_1 - S_{T_1} \cos \alpha_1 \sin \beta_1$$

$$= (x_1 - \hat{x}_1) CX_1 \quad (C-19)$$

$$S_{N_1} \cos \alpha_1 + T_1 \sin \alpha_1 \cos \beta_1 - S_{T_1} \sin \alpha_1 \sin \beta_1$$

$$= (y_1 - \hat{y}_1) CY_1 \quad (C-20)$$

$$S_{T_1} \cos \beta_1 + T_1 \sin \beta_1 = (z_1 - \hat{z}_1) CZ_1 \quad (C-21)$$

$$Q_1 = (\theta_1 - \hat{\theta}_1) CT_1 \quad (C-22)$$

$$M_{N_1} = (\beta_1 - \hat{\beta}_1) CB_1 \quad (C-23)$$

$$M_{T_1} \cos \beta_1 + Q_1 \sin \beta_1 = (\alpha_1 - \hat{\alpha}_1) CA_1 \quad (C-24)$$

where CX, CY, CZ, CT, CB and CA are the mooring spring constants in the x, y, z, θ , β , α directions respectively. Initial (zero force) positions of the moorings are specified as \hat{x}_1 , \hat{y}_1 , \hat{z}_1 , $\hat{\theta}_1$, $\hat{\beta}_1$ and $\hat{\alpha}_1$. The subscript 1 refers to the free end of the 1' st element.

Boundary conditions for the free end of the last element have the same form as the above equations but have the opposite sign on the right hand terms.

HYDRONAUTICS, Incorporated

C-9

All of the above equations may be expressed as a linear, small amplitude perturbation about an assumed solution. The resulting "expanded" equation include the derivatives of all the applied load functions with respect to boom position. These are needed to ensure a stable set of equations and are evaluated at the mid-point of each element. The expanded equations are presented below. Terms marked (̄) are assumed values and are obtained from the previous iteration. They form the basis for the linear expansion.

The numerical solution of these equations is carried out on an IBM 1130 digital computer. They have been arranged in matrix form and are solved using Gauss' reduction method (Reference 1). Because of the necessity of expanding non-linear terms, an iterative calculation procedure is required. The calculations for the hydrodynamic loads on the boom (T_1 , SN_1 , ST_1 , Q_1) are based on the boom position in the previous iteration. The calculated position from the previous iteration thus forms the assumed position for the expansion in each successive iteration.

APPENDIX D
DYNAMIC EQUATIONS

The following paragraphs provide a brief description of the method currently in use for analysis of the dynamic performance of an oil retention boom in a seaway.

The Seaway

The seaway is assumed to be made up of a spectrum of longcrested, sinusoidal waves. Therefore, in the boom coordinate system the unit amplitude wave potential, Φ_W , may be expressed as

$$\Phi_W = c e^{-k_0 z} + i[\omega t - k_0(x \cos \theta + y \sin \theta)] \quad (D-1)$$

where

$$c = \text{wave speed, ft-sec}^{-1}, = \omega/k_0 = \sqrt{g/k_0}$$

$$k_0 = \text{wave number, ft}^{-1}, = 2\pi/\lambda = \omega^2/g$$

z = vertical position coordinate measured from the mean water surface (positive down), ft

ω = wave frequency, rad-sec⁻¹

t = time, sec

x = position coordinate on the mean free surface and parallel to the boom axis, ft

y = position coordinate on the mean free surface and normal to the boom axis, ft

θ = angle between the boom axis and direction of wave propagation, rad

λ = wave length, ft

HYDRONAUTICS, Incorporated

D-2

The unit amplitude wave particle velocities in the x, y, and z directions are given by the partial derivatives $\partial \phi_w / \partial x$, $\partial \phi_w / \partial y$, and $\partial \phi_w / \partial z$, respectively. Similarly, particle accelerations in these three directions are given by $\partial^2 \phi_w / \partial t \partial x$, $\partial^2 \phi_w / \partial t \partial y$, and $\partial^2 \phi_w / \partial t \partial z$. The unit amplitude position of the free surface, ξ , is given by

$$\frac{1}{g} \frac{\partial \phi_w}{\partial t} \Big|_{z=0} = \frac{i c w e^{i[\omega t - k_o(x \cos \theta + y \sin \theta)]}}{g} \quad (D-2)$$

It is convenient to focus attention to the point $x = 0$, $y = 0$. Then, Equation (D-2) reduces to

$$\xi = i e^{i \omega t}, \text{ ft per ft of wave amplitude} \quad (D-3)$$

The motion equations in the vertical (heave) and horizontal (sway) planes are generally similar, but are discussed separately to point out important differences.

Motion Equations on the Vertical Plane

The oil boom is treated as a continuous elastic beam floating on the water surface. The governing differential equation is:

$$EI \frac{\partial^4 w}{\partial x^4} - T \frac{\partial^2 w}{\partial x^2} + M \frac{\partial^2 w}{\partial t^2} = P_w - P_H \quad (D-4)$$

HYDRONAUTICS, Incorporated

D-3

where

E = modulus of elasticity, $\text{lb}\cdot\text{ft}^{-2}$

I = boom section moment of inertia, ft^4

T = tension, lb

M = boom mass per unit length, $\text{lb}\cdot\text{sec}^2\cdot\text{ft}^{-2}$

w = vertical displacement of the boom, ft

P_W = hydrodynamic loading per unit length on a straight boom
due to waves, $\text{lb}\cdot\text{ft}^{-1}$

P_H = hydrodynamic loading per unit length on a deflected boom
in still water, $\text{lb}\cdot\text{ft}^{-1}$

Note that the right hand side of Equation (D-4) ($P_W - P_H$) is the combined hydrodynamic loading on a moving boom in a moving sea.

P_W and P_H can be expressed as

$$P_W = \frac{K}{g} \left. \frac{\partial \phi_W}{\partial t} \right|_{z=0} + (m^* + m') \frac{\partial^2 \phi_W}{\partial t \partial z} + \delta \frac{\partial \phi}{\partial z} \quad (\text{D-5})$$

$$P_H = m' \frac{\partial^2 w}{\partial t^2} + \delta \frac{\partial w}{\partial t} + Kw \quad (\text{D-6})$$

where

K = buoyant stiffness per unit length of the boom due to
its waterplane area, $\text{lb}\cdot\text{ft}^{-2}$

m^* = mass of the displaced water per unit length of boom
= M

m' = added mass per unit length, $\text{lb}\cdot\text{sec}^2\cdot\text{ft}^{-2}$

δ = boom damping coefficient per unit length, $\text{lb}\cdot\text{sec}\cdot\text{ft}^{-2}$

HYDRONAUTICS, Incorporated

D-4

Hydrodynamic coefficients which may be approximated by formulae found in the literature concerning ship motions are added mass m' , damping δ , and buoyant stiffness K :

$$\begin{aligned} m' &\approx \frac{\pi}{8} \rho B^{*2} \\ \delta &\approx \frac{\rho g^2}{w^2} \frac{w^2 B^{*2}}{g} \\ K &\approx \rho g B^* \end{aligned} \quad (D-7)$$

where

ρ = mass density of water, $\text{lb-sec}^2\text{-ft}^{-4}$

B^* = beam at the waterline, ft

The vertical displacement of the boom, w , is assumed to have the form

$$w = (a + ib) e^{i(\omega t - k_x x - k_y y)} \quad (D-8)$$

The preceding equations are used to obtain:

$$\begin{aligned} &(a + ib) [EI k_x^4 + Tk_x^2 + K + i\delta w \\ &- (m + m') w^2] e^{i(\omega t - k_x x - k_y y)} \\ &= \left\{ i \left[K - (m^* + m') e^{-k_0 z} \right] \right. \\ &\left. - \delta e^{-k_0 z} w \right\} \cdot e^{i(\omega t - k_x x - k_y y)} \quad (D-9) \end{aligned}$$

HYDRONAUTICS, Incorporated

D-5

where

$$k_x = k_o \cos \theta$$

$$k_y = k_o \sin \theta$$

z_ℓ = "effective" hydrodynamic depth, ft.

The term z_ℓ replaces z in Equation (D-1); z accounts for the reduction, with depth, of orbital velocity in water waves. The effective depth z_ℓ is approximately one-half the boom draft.

The real and imaginary parts of Equation (D-8) are separated to determine the quantities a and b , the "in-phase" and "out-of-phase" components of the boom response.

$$a = \frac{[-\Omega + Ke^{k_o z_\ell} - (m^* + m')w^2] e^{-k_o z_\ell}}{[\Omega^2 + (\delta w)^2]} \quad (D-10)$$

$$b = \frac{\left\{ \Omega \left[Ke^{k_o z_\ell} - (m^* + m')w^2 \right] + (\delta w)^2 \right\} e^{-k_o z_\ell}}{[\Omega^2 + (\delta w)^2]} \quad (D-11)$$

where

$$\Omega \equiv EI k_x^4 + Tk_x^2 + K - (m + m')w^2 \quad (D-12)$$

Resonance occurs at frequencies (w 's) for which the term Ω is numerically equal to zero. In the absence of the hydrodynamic damping δ , the response would be unbounded at the resonant frequencies.

HYDRONAUTICS, Incorporated

D-6

The unit heave response amplitude $|w|$ can now be defined using a and b from Equations (D-10) and (D-11):

$$|w|^2 = a^2 + b^2 \quad (D-13)$$

Thus, the heave for a unit amplitude wave is given (at $x = 0$, $y = 0$) by:

$$w = \sqrt{|w|^2} e^{i(\omega t + \phi_1)} \quad (D-14)$$

where ϕ_1 = phase angle between waves and motions.

The unit response amplitudes for various quantities of interest are now defined.

Immersion. The relative position of the boom with respect to the free surface:

$$\begin{aligned} h &= w - \xi = [a + i(b-1)] e^{i\omega t} \\ &= \sqrt{|h|^2} e^{i(\omega t + \phi_2)} \end{aligned} \quad (D-15)$$

Note: ϕ_2 the phase angle has a different value here than ϕ_1 in Equation (D-14).

HYDRONAUTICS, Incorporated

D-7

Bending Moment.

$$M = -EI \frac{\partial^3 w}{\partial x^3} = EI k_x^3 \sqrt{|w|^2} e^{i(\omega t + \phi_1)}$$

$$= \sqrt{|M|^2} e^{i(\omega t + \phi_1)} \quad (D-16)$$

Shear.

$$S = -EI \frac{\partial^2 w}{\partial x^2} = -i EI k_x^2 \sqrt{|w|^2} e^{i(\omega t + \phi_1)}$$

$$= \sqrt{|S|^2} e^{i(\omega t + \phi_3)} \quad (D-17)$$

Slope.

$$\frac{\partial w}{\partial x} = ik_x \sqrt{|w|^2} e^{i(\omega t + \phi_1)} = \sqrt{|\frac{\partial w}{\partial x}|^2} e^{i(\omega t + \phi_4)} \quad (D-18)$$

Curvature.

$$\frac{M}{EI} = \frac{1}{EI} \sqrt{|M|^2} e^{i(\omega t + \phi_1)} \quad (D-19)$$

Relative Pitch Angle Between Two Adjacent Points

The linearized pitch angle at any point is given (in radians) by the slope $\partial w / \partial x$. The relative pitch between any two points along the boom axis separated by a distance Δx is

HYDRONAUTICS, Incorporated

D-8

given by the change in slope between the two points.

$$\begin{aligned}\beta &= \left. \frac{\partial w}{\partial x} \right|_{x=0} - \left. \frac{\partial w}{\partial x} \right|_{x=\Delta x} = \left(1 - e^{-ik_x \Delta x} \right) \frac{\partial w}{\partial x} \\ &= \sqrt{|\beta|^2} e^{i(\omega t + \phi_0)} \quad (D-20)\end{aligned}$$

This quantity is used for comparison with the model tests where Δx corresponds to the segment length of the model.

Motion Equations in the Horizontal Plane

The governing differential equation in the horizontal plane is:

$$EI \frac{\partial^4 v}{\partial x^4} - T \frac{\partial^2 v}{\partial x^2} + M \frac{\partial^2 v}{\partial t^2} = P_W - P_H \quad (D-21)$$

This equation is analogous to Equation (D-4); for simplicity, the same symbols are used here, but their values are generally not the same as in the horizontal plane.

The hydrodynamic loading terms have the same form as for the vertical plane except there are no buoyant stiffness terms:

$$P_W = (m^* + m') \left(\frac{\partial^2 \phi_w}{\partial t \partial y} \right) + \delta \left(\frac{\partial \phi_w}{\partial y} \right) \quad (D-22)$$

$$P_H = m' \frac{\partial^2 v}{\partial t^2} + \delta \frac{\partial v}{\partial t} \quad (D-23)$$

HYDRONAUTICS, Incorporated

D-9

The hydrodynamic added mass and damping coefficients in the horizontal plane are approximated by: (Reference 5)

$$m' = \frac{\pi}{2} \rho H^{*2} \left[Q_1 + \frac{4H^*}{\pi g} w^2 (Q_2 + Q_3 - Q_4) \right] \quad (D-24)$$

and

$$\delta = \frac{\rho w^5}{16g^2} B^{*4} \left[\frac{\pi(1 - a_1)}{(1 + a_1 + a_3)^2} \right]^2 \quad (D-25)$$

where Q_1 , Q_2 , Q_3 , Q_4 , a_1 and a_3 are all functions only of the beam B^* and draft H^* of the boom.

The horizontal displacement is assumed to have the form

$$v = (c + id) e^{i(\omega t + k_x x - k_y y)} \quad (D-26)$$

Then, Equation (D-21) may be solved:

$$(c + id) \left[EI k_x^4 + Tk_x^2 - (m + m') w^2 + i\delta w \right] e^{i(\omega t - k_x x - k_y y)} \\ = [(m^* + m') w^2 - i\delta w] \left[(\sin \theta) e^{-k_o z t} \right] e^{i(\omega t - k_x x - k_y y)} \quad (D-27)$$

Therefore:

$$c = \frac{[\Omega (m^* + m') - \delta^2]}{[\Omega^2 + (\delta w)^2]} w^2 (\sin \theta) e^{-k_o z t} \quad (D-28)$$

HYDRONAUTICS, Incorporated

D-10

$$d = \frac{-[\Omega + (m^* + m') w^2] \delta w (\sin \theta) e^{-k_o z_t}}{[\Omega^2 + (\delta w)^2]} \quad (D-29)$$

where

$$\Omega = EI k_x^4 + Tk_x^2 - (m + m') w^2 \quad (D-30)$$

Resonant frequencies occur at values of Ω equal to zero, as in the vertical plane. However, the resonant frequencies in the two planes do not coincide because the spring constant K does not appear in the horizontal equations and the added mass (m') term has different magnitudes in the two planes.

The unit sway response amplitude $|v|$ is now determined by:

$$|v|^2 = c^2 + d^2 \quad (D-31)$$

The sway for a unit amplitude wave is, then:

$$v = \sqrt{|v|^2} c^{1/2} (\omega t + \phi_0) \quad (D-32)$$

Equations analogous to those given for the vertical plane are used to define the unit response amplitudes for bending moment, shear, slope, curvature and yaw angle in the horizontal plane.

Statistical Evaluation of Boom Response

Once the response of the boom has been determined in terms of unit response amplitudes, it is relatively easy to find the response spectra for any desired spectrum of wave energy. In

HYDRONAUTICS, Incorporated

D-11

In this study the Pierson-Moskowitz spectrum was used (Equation (13)). The spectral density of any quantity $q(\omega)$ at any wave frequency is just the product of its unit response amplitude squared $|q(\omega)|^2$ and the (amplitude squared) spectral density of the wave spectrum $S(\omega)$. The root-mean-squared amplitude of a spectrum is found by integrating to find the square root of the area under the curve of spectral density. Thus, the rms wave amplitude is given by:

$$a_{rms} = \left[\int_0^\infty S(\omega) d\omega \right]^{\frac{1}{2}} \quad (D-33)$$

The rms value of the quantity q is then

$$q_{rms} = \left[\int_0^\infty |q(\omega)|^2 S(\omega) d\omega \right]^{\frac{1}{2}} \quad (D-34)$$

Finally, the statistical properties of the Rayleigh distribution formula are used to find:

$$\text{average, } \bar{q} = 0.885 q_{rms}$$

$$\text{average of one-third highest (significant), } \bar{q}_{\frac{1}{3}} =$$

$$1.41 q_{rms}$$

$$\text{average of one-tenth highest, } \bar{q}_{1/10} = 1.80 q_{rms}$$

and

$$\text{maximum expected value, } |q|_{max} = 3.4 q_{rms}$$

HYDRONAUTICS, Incorporated

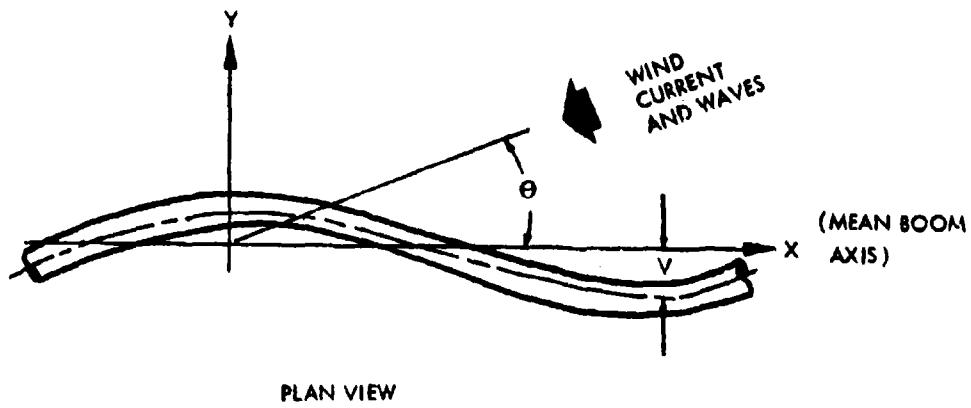

D-12

Note: The significant wave height \bar{H}_s is just twice the significant wave amplitude. Thus,

$$\bar{H}_s = 2.83 \left[\int_0^{\infty} S(w) dw \right]^{\frac{1}{2}} \quad (D-35)$$

where $S(w)$ is defined by Equation (13).

13. ABSTRACT A theoretical analysis of the loads and motions of a continuous, elastic, oil retention boom of arbitrary configuration, is presented. The boom is subjected to loads of wind, current, and an irregular sea. The analytical method was programmed for an IBM 1130 computer and used to generate data for a variety of oil booms. Towing tank test were conducted on selected boom configurations and serve to check the theoretical analysis.

INSTRUCTIONS						
1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantees, Department of Defense activity or other organization (corporate author) issuing the report.	imposed by security classification, using standard statements such as:					
2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.	(1) "Qualified requesters may obtain copies of this report from DDC."					
2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.	(2) "Foreign announcement and dissemination of this report by DDC is not authorized."					
3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.	(3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."					
4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.	(4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."					
5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.	(5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."					
6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.	If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.					
7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.	11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.					
7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.	12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.					
8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.	13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.					
8b, &c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.	It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (T3), (S), (C), or (U).					
9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.	There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.					
9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).	14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, roles, and weights is optional.					
10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those
